Title: AI Study Assistant Using RAG

Problem Statement:

Students often find it difficult to manage and search through large amounts of study materials such as PDFs, notes, and assignments. Traditional searching methods are slow and inefficient when quick answers or explanations are needed. Most AI study tools also rely on cloud services, which can create privacy concerns and require constant internet access.

This project aims to develop a local Retrieval-Augmented Generation (RAG) system using the Qwen 1.5 model with Ollama. The system allows students to upload study documents, store them locally, and ask questions based on the uploaded content. Using semantic search and AI-generated responses, the application provides accurate and context-aware answers. The project focuses on creating a privacy-friendly, offline-capable, and efficient AI study assistant for personalized student learning.

Objectives:

1. Build a local RAG-based study assistant using Qwen 1.5 and Ollama.
2. Allow users to upload and manage study documents locally.
3. Generate accurate answers using AI and retrieved context.
4. Provide offline access and maintain user data privacy.
